1. Introduction

In this project I plan and build a small website with the skills I am learning in WEDE5020. The task asks me to write two proposals for two different organisations and then pick one to build. I picked LUMILA as my main project. LUMILA is a business I made up for this task, and so is my second one, Sweet Corner. My lecturer still needs to approve my choice before I go ahead.

2. Proposal One: LUMILA

Organisation overview

LUMILA is an online shop I made up for the Angolan market. It sells clothes, accessories and lifestyle products through a simple website. It is a new idea, so it has no sales history, no physical shop, no stock list and no website yet. Its mission is to make everyday shopping easier by giving clear product information and an easy way to ask questions. Its vision is to become an online shop people trust for everyday style. I am aiming it at young adults and working people who use their phones to find products and contact shops.

Website goals and objectives

I want the website to present the business, sort the products into categories and make it easy for people to send questions. To see if it works, I will look at the number of visits, product page views, enquiry forms sent, contact messages and how many people go from a product page to the enquiry page. These numbers will show me if the site is useful to visitors and helps the business.

Current website analysis

LUMILA is a new business, so there is no website for me to review. That means I cannot point out real strengths or weaknesses. What I can do is build a clear first website with simple menus, easy reading and separate pages for product questions and general contact.

Proposed features and functionality

My website will have five pages: Home, About, Products, Enquiry and Contact. Home introduces the shop and sends people to the product categories. About explains the mission, vision and who the shop is for. Products splits the items into clothes, accessories and lifestyle. Enquiry is for questions about a product, and Contact is for general messages. Later on I want to add a product search, a gallery, a lightbox, form checks and a map once there is a real address.

Design and user experience

I want a clean, modern look with a warm neutral background, dark green headings and a soft terracotta accent. My colours are cream (#F3EEE8), dark green (#263C36), terracotta (#B9785B) and white (#FFFFFF). I will use Aptos or Arial because they are easy to read, with bigger headings and clear body text. The menu will be the same on every page. I will use clear sections, easy-to-see buttons and enough space so people can find things without getting lost. My wireframe plan is in Section 5.

Technical requirements

I will write the pages in HTML5 using Visual Studio Code. The site will have five HTML files, plus CSS and JavaScript folders ready for the next parts of the PoE. I will use Git to track my changes and the private GitHub repository my lecturer gave me. For the final version I can host the site for free on GitHub Pages or Netlify, if my lecturer agrees. I will test the site in up-to-date browsers on a computer and on a phone.

Timeline and budget

First I will get approval and plan the work. Then I will get the content ready, draw the sitemap and set up my folders. After that I will build the five HTML pages, test every link and write the README. Since I am using free tools and free hosting, I think this student version will cost between 0 and 10,000 Kz. A custom domain, paid hosting, professional photos or ongoing upkeep would cost more and would need their own quotes. This is my own rough estimate, not a quote from a supplier.

3. Proposal Two: Sweet Corner

Organisation overview

Sweet Corner is the second business I made up for this task. It is a small local bakery that makes cakes, cupcakes, pastries and party boxes made to order. Its mission is to sell fresh baked goods and make it easy to order treats for everyday or special days. Its vision is to become a well-known local bakery with friendly service and good-looking products. I am aiming it at families, students, office workers and people planning birthdays or small parties.

Website goals and objectives

I want the website to show what the bakery sells, explain how custom orders work and help people ask about prices or what is available. To see if it works, I would look at visits to the menu page,

clicks on the custom order button, enquiries sent and how many people open the contact page. This would tell me if the site helps people find products and start an order.

Current website analysis

Sweet Corner is a new business, so it has no website for me to look at. This site would be its first one online. The main problem is that customers need clear details about flavours, sizes, how long orders take and how to collect them. I would sort this by showing the product groups clearly and saying that final prices and availability must be checked with the bakery.

Proposed features and functionality

My website for Sweet Corner would have five pages: Home, About, Menu, Custom Order and Contact. Menu groups cakes, cupcakes and pastries. Custom Order asks for the occasion, the date, the type of product, how many and the customer's details. Contact has a general message form and the bakery's real contact details once I have them. Later on I would add a menu search, a photo gallery, a lightbox and form checks.

Design and user experience

I want a bright and friendly look using soft cream (#FFF7ED), cocoa brown (#5A3825), berry pink (#C65D78) and white (#FFFFFF). I would use a simple sans-serif font so it is easy to read. Photos of the products matter a lot here, but I would only use my own photos or ones I am allowed to use. The menu and order buttons need to be easy to find, especially on a phone.licensed would be used. The navigation and order buttons should be easy to find, especially on mobile screens.

Technical requirements

I would build this site with HTML5, CSS and JavaScript in Visual Studio Code. It would have five pages, an images folder, one CSS file and one JavaScript file. I would save my progress on GitHub with clear commit messages. When it is done, I could put it online with a free host if my lecturer agrees.

Timeline and budget

I would start by getting my proposal approved and looking into the products. Then I would plan the pages, build the five HTML pages, test the links and write the README. With free tools and placeholder content, I think this student version would cost between 0 and 15,000 Kz. Real product photos, ingredient and packaging details, a custom domain or paid hosting would push the cost up. This is my own rough estimate, not a quote from a supplier.

4. Comparative decision and recommended project

Both of my proposals cover two different organisations, as the task asks. I chose LUMILA to build because its five pages let me show the business, its product groups, product questions and general contact. It also leaves me room to add a search and other interactive features in Part 3. This is my choice, but my lecturer still has to approve it.

5. Initial sitemap and wireframe plan

5.1 LUMILA sitemap

Home (index.html) → About (about.html); Products (products.html) → Enquiry (enquiry.html); Contact (contact.html). All five pages use the same menu and footer.

5.2 Low-fidelity wireframe plan

Home page

Header/logo and navigation → introduction/hero message → product category links → short shopping information → footer.

About page

Header/navigation → page title → organisation story → mission and vision → target audience → footer.

Products page

Header/navigation → page title → category sections/cards → enquiry call to action → footer.

Enquiry page

Header/navigation → page title and instructions → name/email/category/product question fields → submit control → footer.

Contact page

Header/navigation → page title → general contact form → planned contact/location information → footer.

6. Technical requirements

In my first version I use semantic HTML elements so the pages have a clear structure. I use headings, paragraphs, lists, links, forms and labels. The five pages are linked through the same menu. I have set up the CSS and JavaScript folders for Parts 2 and 3. For the banner I made my own

SVG image instead of using someone else's photo. I added useful alt text to images and labels to form fields, as the W3C accessibility guides suggest (W3C WAI, n.d.).

7. Timeline and budget

Milestone	Activity	Planned output
1	Proposal preparation and approval	Two proposals submitted to lecturer
2	Research and content sourcing	Content notes and asset record
3	Website planning	Sitemap and folder structure
4	HTML development	Five linked HTML pages
5	Testing and documentation	Navigation checks and README update

My budget for the LUMILA student version is 0 to 10,000 Kz, using free software and free hosting. This does not include a paid domain, paid hosting, professional photos or the costs of running a real business.
